Office Action Summary

Art Unit: 3744

The following is a quotation of the appropriate paragraphs of 35 U.S.C. § 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless --

(e) the invention was described in a patent granted on an application for patent by another filed in the United States before the invention thereof by the applicant for patent, or on an international application by another who has fulfilled the requirements of paragraphs (1), (2), and (4) of section 371(c) of this title before the invention thereof by the applicant for patent.

Claims 1-2 and 39-40 are rejected under 35 U.S.C. 102(e) as being anticipated by Gelber et al. Gelber discloses a control system for a plurality of cooling devices in which an attached control means 30 has a wireless interface 94.

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 3-38 and 41-69 are rejected under 35 U.S.C. 103(a) as being unpatentable over Gelber et al as applied to claim 1 above, and further in view of Simon. Gelber discloses controlling a plurality of food storage compartments wherein each compartment has temperature settings, defrost parameters and alarm parameters (see col. 7, lines 3-65). Gelber does not disclose a wireless communication between cooling device 28 and control means 30.

Art Unit: 3744

Simon teaches the use of wireless communication between cooling devices, temperature probes and control means in order to reduce wiring between elements of a refrigeration system. It would have been obvious to one of ordinary skill in the art at the time the invention was made to have modified the system of Gelber such that it included use of wireless communication between cooling devices, temperature probes and control means in order to reduce wiring in view of the teachings of Simon. It is considered to have been an obvious matter of engineering design choice as to the specific information about each cooling compartment that is stored in the memory of the control means.
